Summary of Air Emission Estimations from Point Sources
In Allegheny County
Years 2000-2012 for Criteria Air Pollutants
And 2000-2012 for Hazardous Air Pollutants

Executive Summary

Point source air emissions in Allegheny County have declined significantly since 1996. In 2012 emissions of criteria pollutants decreased an additional 21.2 % from reported 2011 levels primarily because sulfur dioxide emissions fell 51.7% countywide. This decrease was larger than the 3.6 % decline observed in 2011 because Cheswick operated the flue gas desulfurization (FGD) system for 99.7% of total plant operating hours. Countywide emissions of carbon monoxide fell 11.6 %, those of PM₁₀ 3.6%, and VOCs 11.2%. Nitrogen oxide (NO_x) emissions increased 7.4%. Cheswick severely limited operation of its selective catalytic reduction (SCR) equipment, preferring to maximize operation of the FGD. Consequently, emissions of NO_x from this plant increased 36.1 %. Declines of total criteria pollutants have been observed every year since 2004 and year over year have averaged 11.4%.

Since 1996 emissions of carbon monoxide (CO) have declined 43.3%, nitrogen oxides 53.0%, PM₁₀ 63.5% and volatile organic compounds (VOCs) 70.8%. The decline in sulfur dioxide (SO₂) emissions between 1996 and 2012 is 86.2%. Emissions of sulfur dioxide have fallen 94.2% since 2009 because operation of the flue gas desulfurization system at Cheswick has been fairly reliable. Sulfur dioxide emissions from this source constitute 29.6% of total countywide emissions of this pollutant rather than the 80% reported previous to 2009. The station is located on the Allegheny River in Springdale, PA. SO₂ emissions can vary with the demand for electrical power and/or the sulfur content of the coal burned. In 2012 the facility emitted 79.4 % less sulfur dioxide than in 2011. The reported sulfur content of the coal burned in 2012 was 3.87% versus 3.19% in 2011. The ongoing availability of the flue gas desulfurization system allowed the source to use higher sulfur coal and still emit 94.2% less sulfur dioxide than in 2009. The use of CEMS at this plant has improved the accuracy of emission estimates.

The US Clairton Coke Works is now the largest source of criteria pollutants in Allegheny County. Total emissions of criteria pollutants are 17% greater than those from Cheswick.

Between 2000 and 2012 emissions from the US EPA list of 187 Hazardous Air Pollutants (HAPs) decreased 72.8%. The table below lists the year over year changes in the total amount of HAPS reported in the Allegheny County Emission Inventory.

HAP Emissions Trends in Allegheny County 2000 - 2012					
Year	Total HAP Emissions (tons)	Percent Change. Total	Percent Change. Other	Percent Change. HCl	Percent Change. HF
2000	2463				
2001	2566	4.18 +	9.9 -	14.9 +	15.0 +
2002	2145	16.4 -	10.2 -	21.3 -	21.1 -
2003	2396	11.7 +	6.9 -	26.4 +	25.8 +
2004	2191	8.6 -	2.9 +	15.3 -	14.8 -
2005	2030	7.4 -	4.6 +	11.6 +	1.0 -
2006	1944	4.2 -	18.5 -	1.3 -	1.0 +
2007	2150	10.6 +	13.4 -	24.6 +	3.9 -
2008	1546	28.1 -	8.0 -	36.1 -	19.0 -
2009	1550	0.3 +	5.3 -	2.7 +	6.2 +
2010	1449	6.5 -	18.4 +	17.1 -	24.4 -
2011	899	38 -	8.8 -	56.1 -	64.6 -
2012	670	25.5 -	1.75 -	56.3 -	78.3 -

Emissions of total HAPS as well as the individual HAPS, hydrofluoric acid (HF) and hydrochloric acid (HCl), in the past have correlated with emissions from the Cheswick Power Plant which depending on demand has emitted around 1000 tons or more a year of HAPS as recently as 2007. Emissions of hydrochloric acid and hydrofluoric acid from Cheswick fell steeply in 2012. HF at Cheswick declined 99.6% and HCl declined 98.9 % while the amount of coal burned at this plant fell 5.8%. A co-benefit of the installation of a flue gas desulfurization system at Cheswick is the reduced emissions of acid gases from the facility.

Total point source HAP emissions have trended lower between 1999 and 2012 in Allegheny County but not consistently. Cheswick Power Station no longer accounts for the majority of the emissions of HAPS among the facilities included in the Allegheny County Point Source Inventory. The USS Clairton Coke Works is now the largest source of HCl emissions in the County generating 60.41% of the total of 156.84 tons. The largest source of HF emissions in 2012 was Bay Valley Foods. In 2012 they emitted 2.06 tons of HF or 41.2 % of the total of 4.96 tons. A close runner up was Gottlieb Inc, an aluminum recycler, emitting 36.6 % of the total or 1.83 tons.

Overall HAP emissions declined 25.5% due to the large declines at Cheswick in HCL and HF emissions. After excluding these two compounds from total HAP emissions, the countywide decrease was 1.74%

Emissions of the five criteria pollutants from point sources in the County have trended down since 2000. Emissions from the Cheswick Station no longer mask the overall degree of reduction attributable to the other point sources included in the annual survey to the same degree they have in the past.

Examination of emission trends of both HAPS and criteria pollutants after excluding Cheswick's and Clairton's contributions show overall declines in both categories. Emissions of HAPS have declined 37.8% since 2002. Emissions of nitrogen oxides have fallen by 26.9%; PM₁₀ has decreased 54.7% and volatile organic compounds have fallen 50.2%. Carbon monoxide emissions

fell 28.3% in this period and sulfur dioxide emissions have decreased 26.1%. The desulfurization plant at the Clairton Coke Works with the exception of two major malfunctions in recent years has functioned reliably. Overall the declines observed since 2002 are attributable to closure or reduction in operations of industrial facilities in the County as well as process improvements and the installation of new or improved control equipment at many facilities.

Emissions of both HAPS and criteria pollutants from the Cheswick Power Station and the Clairton Coke Works are proportional to fuel use. This makes the total amount of industrial air pollution in the County highly dependent on the output from these two facilities. However, Cheswick has acted to reduce the amount of pollution generated by its operation. In 2003 nitrogen oxide emissions were reduced by the installation of a Selective Catalytic Reduction (SCR) device. Cheswick Power Station's flue gas desulfurization unit on the main boiler operated reliably in 2012 with about a 99% availability rating. This reduced emissions of sulfur dioxide by an additional 79.4% in 2012.

Introduction

The annual Air Quality Program's Point Source Emission Inventory Report for 2012 details and analyzes emission estimates from facilities with potential emissions in the categories listed below:

- 25 TPY or more of any criteria pollutant
- 10 TPY or more of any single Hazardous Air Pollutant (HAP)
- 25 TPY or more of any mixture of HAPs

In 1997 reporting of annual emission inventories was converted from a paper system to an electronic system. In 2009, 90.9% of submittals were made to the Allegheny County Health Department Website. The remainder was made by e-mail as the procedure for submitting to the Health Department website was incompatible with many sources networks. For 2010 the Air Quality Program adopted the DEP AES Online System. This system allows for web-based submittals by all sources and complies with the EPA Cross Media Electronic Reporting Rule. In 1998 the availability of emission factors for HAPS increased making possible better estimates of emissions for these compounds.

This report provides graphs and tables comparing air emissions for 2012 to those from previous years. It contains six sections with four attachments.

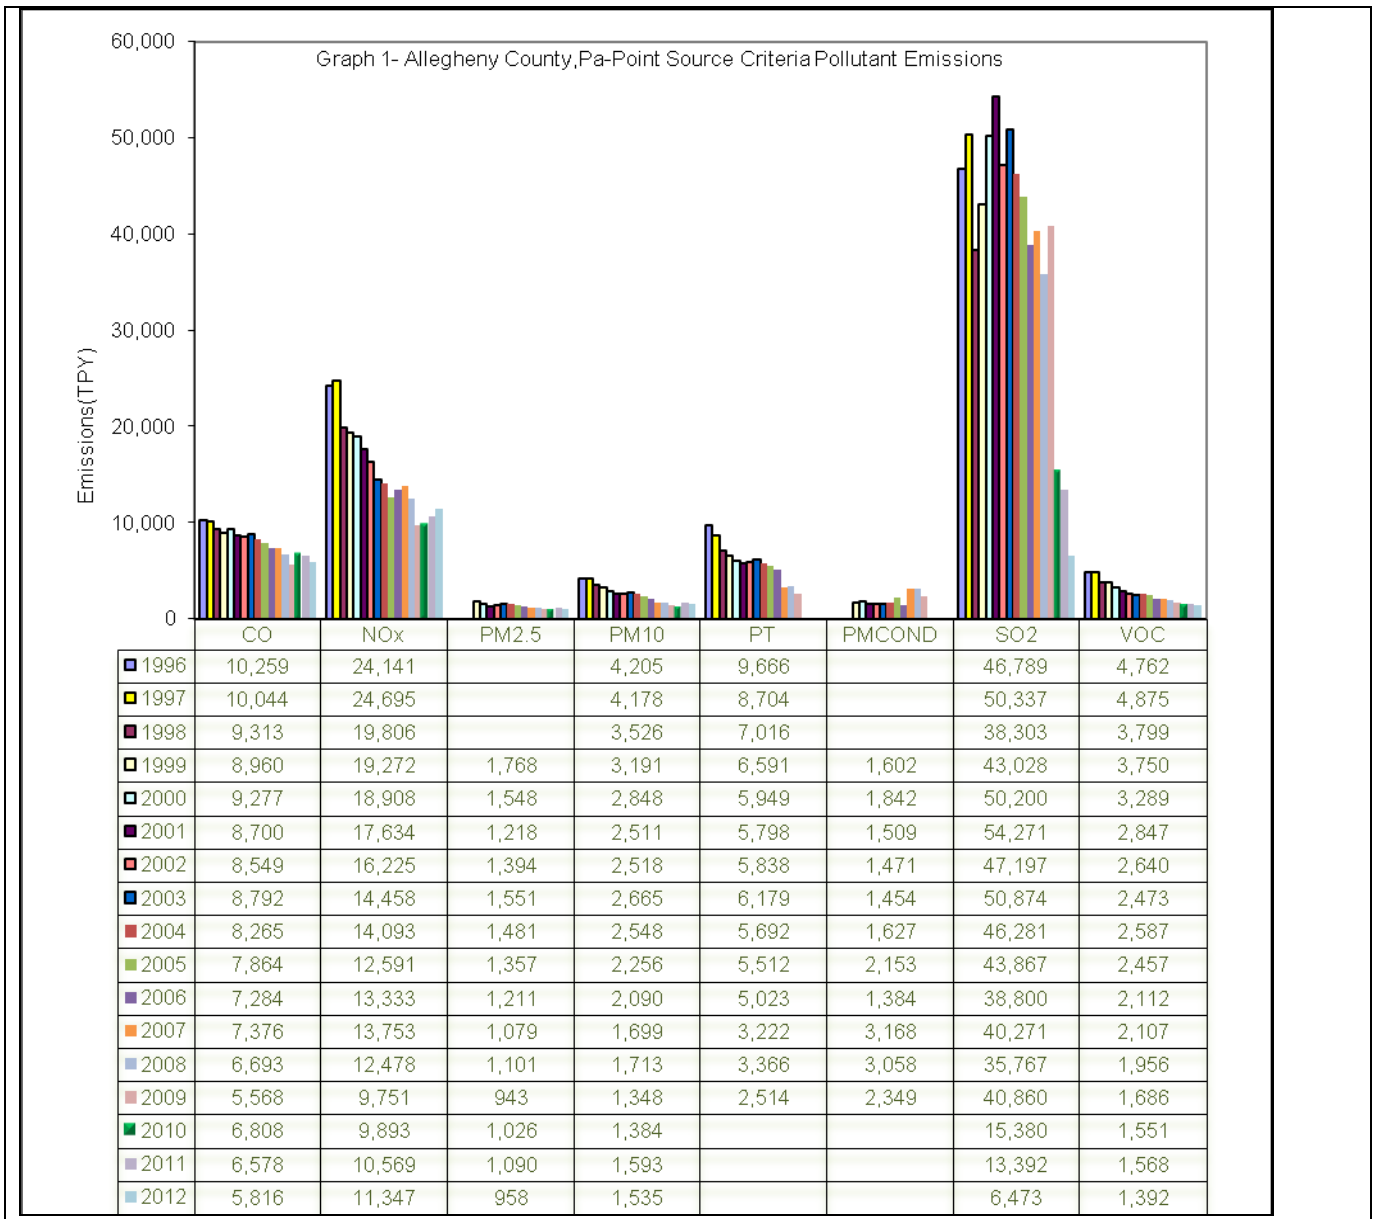

- Section I – Point source Criteria Emission Trends
- Section II – Point Source Criteria emissions by Industry Sector
- Section III – Sources and Form of Particulate Emissions- PM₁₀, PM_{2.5}, filterable and condensable.
- Section IV – Point source HAP Emissions
- Section V – Point Source HAP Emission Trends
- Section VI – Impact of the Reliant Cheswick Power Station and Clairton Coke Works on Total County Point Source Emissions

Trends in emissions of criteria pollutants in the County are discussed by industry sector in Section II. Section VI addresses contributions from the Cheswick Power Station and the Clairton Coke Works to total County point source emissions. These two sources emissions merit a separate section because their total emissions are far greater than those of any other facilities in the County.

- Attachment A – Criteria Pollutant Emissions for Individual Facilities
- Attachment B – List of HAP Emissions by Compound.
- Attachment C – HAP Emissions of Individual Facilities
- Attachment D – Total Point Source Emissions Ammonia

Section I Criteria Pollutant Emissions

Graph 1 summarizes total emissions of criteria air pollutants as defined by the Clean Air Act from point sources in Allegheny County. Please note the DEP AES system does not contain fields where sources can report total particulate and PM condensate. Total particulate is no longer defined as a criteria pollutant by the EPA.

The pollutants shown include:

- CO – carbon monoxide
- NO_x – emissions of oxides of nitrogen reported as nitrogen dioxide
- PM_{2.5} – filterable particulate with an aerodynamic diameter less than 2.5 microns
- PM₁₀ - filterable particulate with an aerodynamic diameter less than 10 microns
- PT- total filterable particulate. No data is available after 2010.
- PMCOND- condensable particulate matter defined as material in the vapor state at temperatures above 68° F and a solid at lower temperatures. No data available for 2010, 2011 and 2012.
- SO₂- sulfur dioxide
- VOCs – Volatile Organic Compounds.

More detailed definitions are provided in the notes located at the end of the report.

In 2012 emissions of carbon monoxide, PM_{2.5}, PM₁₀, sulfur dioxide and VOC's decreased, while only emissions of nitrogen oxides increased. Sulfur dioxide emissions decreased an additional 52% in 2012 compared to the level reported in 2011. This is largely attributable to the continuing decrease in emissions of this pollutant from the Cheswick facility. The plant has continued to improve the operational reliability of its flue gas desulfurization system installed several years ago.

**Table 1 - Estimated Point Source Criteria Air Emission Change in Allegheny County, PA
Tons per Year Emitted as Percentage of 1996 Baseline Year**

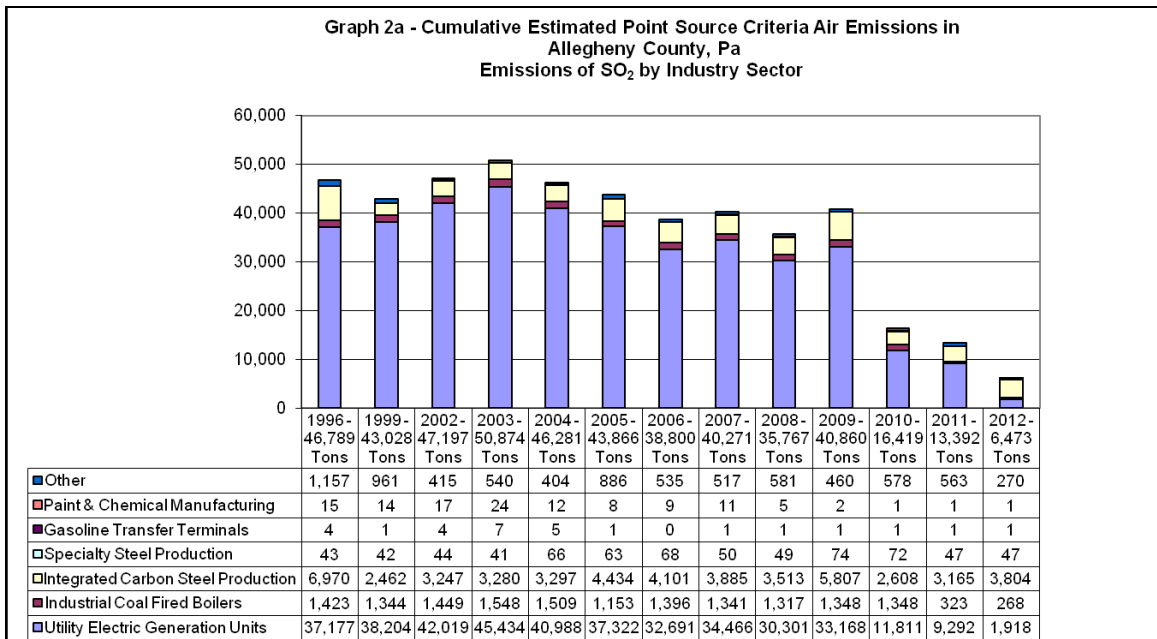

1996 Base Year (Tons/Yr)	Pollutant							
	CO	NOx	PM2.5	PM10	PT	PMCOND	SO2	VOC
	10,259	24,141		4,205	9,666		46,789	4,762
1997	-2.1%	2.3%		-0.7%	-9.9%		7.6%	2.4%
1998	-9.2%	-18.0%		-16.2%	-27.4%		-18.1%	-20.2%
1999	-12.7%	-20.2%	1,768	-24.1%	-31.8%	1,602	-8.0%	-21.3%
2000	-9.6%	-21.7%	-12.5%	-32.3%	-38.5%	15.0%	7.3%	-30.9%
2001	-15.2%	-27.0%	-31.1%	-40.3%	-40.0%	-5.8%	16.0%	-40.2%
2002	-16.7%	-32.8%	-21.2%	-40.1%	-39.6%	-8.2%	0.9%	-44.6%
2003	-14.3%	-40.1%	-12.2%	-36.6%	-36.1%	-9.2%	8.7%	-48.1%
2004	-19.4%	-41.6%	-16.2%	-39.4%	-41.1%	1.6%	-1.1%	-45.7%
2005	-23.3%	-47.8%	-23.2%	-46.4%	-43.0%	34.4%	-6.2%	-48.4%
2006	-29.0%	-44.8%	-31.5%	-50.3%	-48.0%	-13.6%	-17.1%	-55.6%
2007	-28.1%	-43.0%	-39.0%	-59.6%	-66.7%	97.7%	-13.9%	-55.8%
2008	-34.8%	-48.3%	-37.7%	-59.3%	-65.2%	90.9%	-23.6%	-58.9%
2009	-45.7%	-59.6%	-46.7%	-59.3%	-74.0%	46.6%	-12.7%	-64.6%
2010	-33.6%	-59.0%	-42.0%	-67.1%			-67.1%	-67.4%
2011	-35.9%	-56.2%	-38.4%	-62.1%			-71.4%	-67.1%
2012	-43.3%	-53.0%	-45.8%	-63.5%			-86.2%	-70.8%

Trends in emissions of criteria pollutants in the County are discussed by industry sector in Section II. Section VI addresses contributions from the Cheswick Power Station and Clairton Coke works to total County point source emissions.

Section II Criteria Point Source Air Emissions by Industrial Sector

Graphs 2a-2e details emissions of each criteria pollutant from individual point source industrial sectors in the County. The six industrial sectors identified account for approximately 87% of all criteria point source air emissions. Facilities are sorted into sectors based on the size of their contribution to total air emissions. With the exception of sulfur dioxide, which fluctuates from year to year depending on the demand for electricity from the Cheswick Power Station and coke from USS Clairton Works, the overall direction of emissions of criteria pollutants continued to decline in 2012. Contributions from individual sectors show declines from the 1996 base year despite some increases attributable to variable business conditions.

a) Sulfur Dioxide

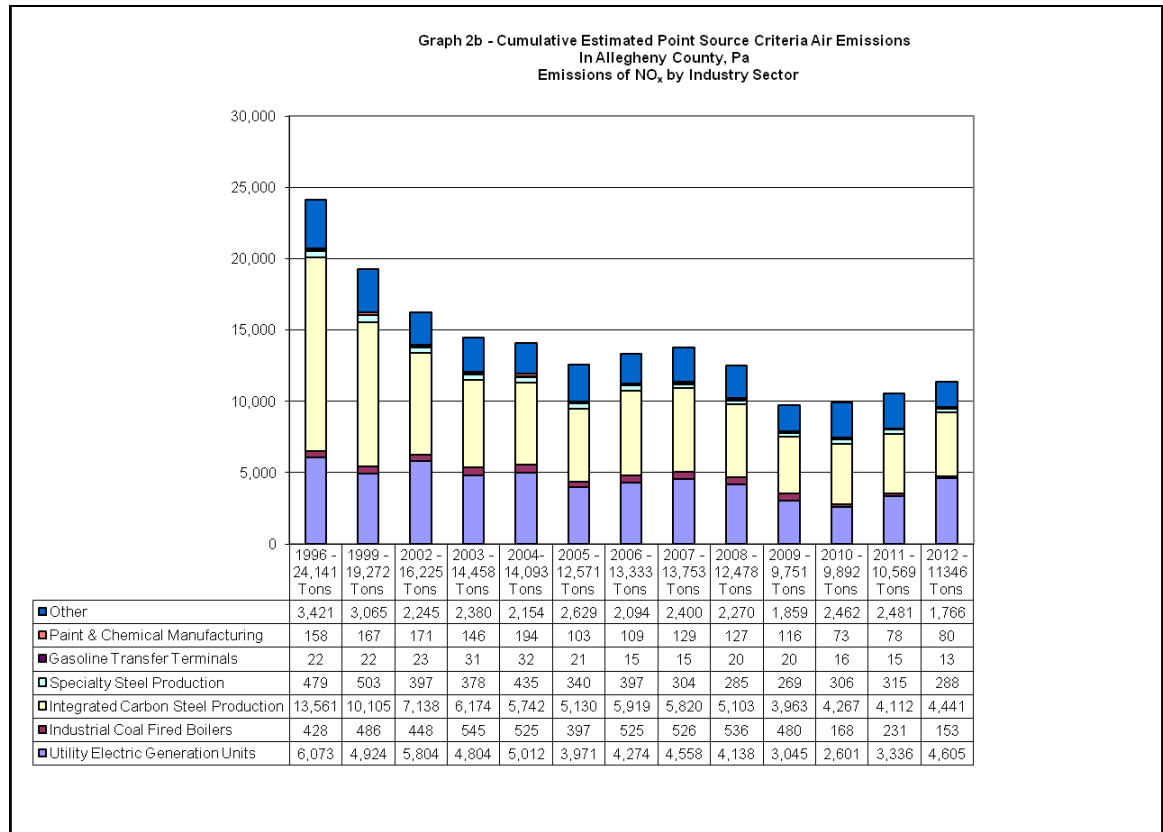

Sulfur dioxide emissions increased in the integrated carbon steel sector in 2012. It declined or was unchanged in the other six major industrial sectors. In 2012 sulfur dioxide emissions decreased 51.7% overall from the levels reported in 2011. Currently, approximately 56.4 % of all sulfur dioxide emissions in the County are from the Cheswick Power Station (29.5%) and the U.S. Steel Clairton Coke Works (26.9%). Emissions of this compound from these two sources are addressed separately in Section VI. Emissions from these two sources combined overwhelm SO₂ emissions from other point sources in the County and determine the overall direction of SO₂ emissions.

The increase in sulfur dioxide from integrated carbon steel production between 2011 and 2012 occurred because the desulfurization plant at Clairton was down eight days in 2012. As a result sulfur dioxide emissions from the Clairton Coke Works were up 18.4% over 2011 or a total of 270.5 tons. Likewise emission of sulfur dioxide from the Edgar

Thomson facility increased 11.9% or 152 tons. The increase in sulfur dioxide emissions from Edgar Thomson is partially attributable to the combustion of coke oven gas from Clairton with a higher sulfur content resulting from the down time of their desulfurization unit.

Fifty percent of the decrease in sulfur dioxide emissions from integrated carbon steel production since 1998 is attributable to the closing of the Hazelwood LTV Coke Works.

b) Nitrogen Dioxide

In 2012 nitrogen oxide emissions overall increased 7.35%. NO_x emissions increased in three sectors and decreased in four. Increases occurred in the following sectors:

- Utility Electric Generation- 38.0%
- Integrated Carbon Steel Production – 8.0 %
- Paint and Chemical Manufacturing – 2.6%

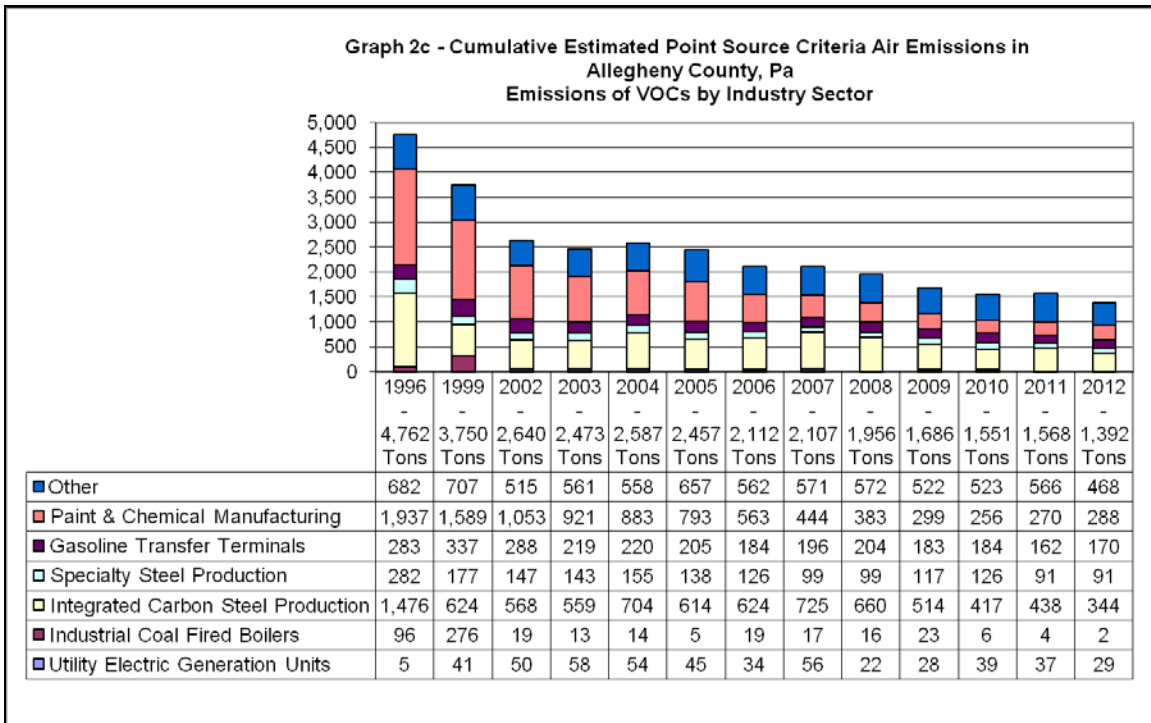

For two of the three sectors the increases can be attributed to small variations in the amounts of raw materials used. Cheswick Power Station operated their SCR minimally in 2012. Therefore their NO_x emissions increased 36.1% without approaching the facility's permit limit for this pollutant.

Decreases were observed in Specialty Steel Production and Gasoline Transfer Terminals. In the Specialty Steel sector NO_x emissions fell 8.6% and 13.3% in the Gasoline Terminal Sector.

The 38.0 % increase in NO_x emissions in the utility sector occurred because the Cheswick Plant did not operate the SCR to any significant extent. Six percent less coal was burned in 2012 than in 2011. But the amount burned without operating the selective catalytic reduction (SCR) equipment increased 4.5 %. Cheswick has determined from testing they can comply with their NO_x emission limit without operating the SCR. SCR operation while decreasing NO_x emissions from the coal fired boiler increases emissions of particulate. The increase in NO_x emissions reflects the plant's current operating configuration.

Unlike the period from 1996 to 2002, no large source of nitrogen oxide emissions has shut down recently. The large decreases in emissions of nitrogen oxides between 1996 and 2003 were largely attributable to the shutdown of the LTV Coke Works in 1998 and the Kosmos Cement kiln in 2001 and the installation of selective catalytic reduction control equipment at the Cheswick Power Station in 2003.

c) Volatile Organic Compounds (VOCs)

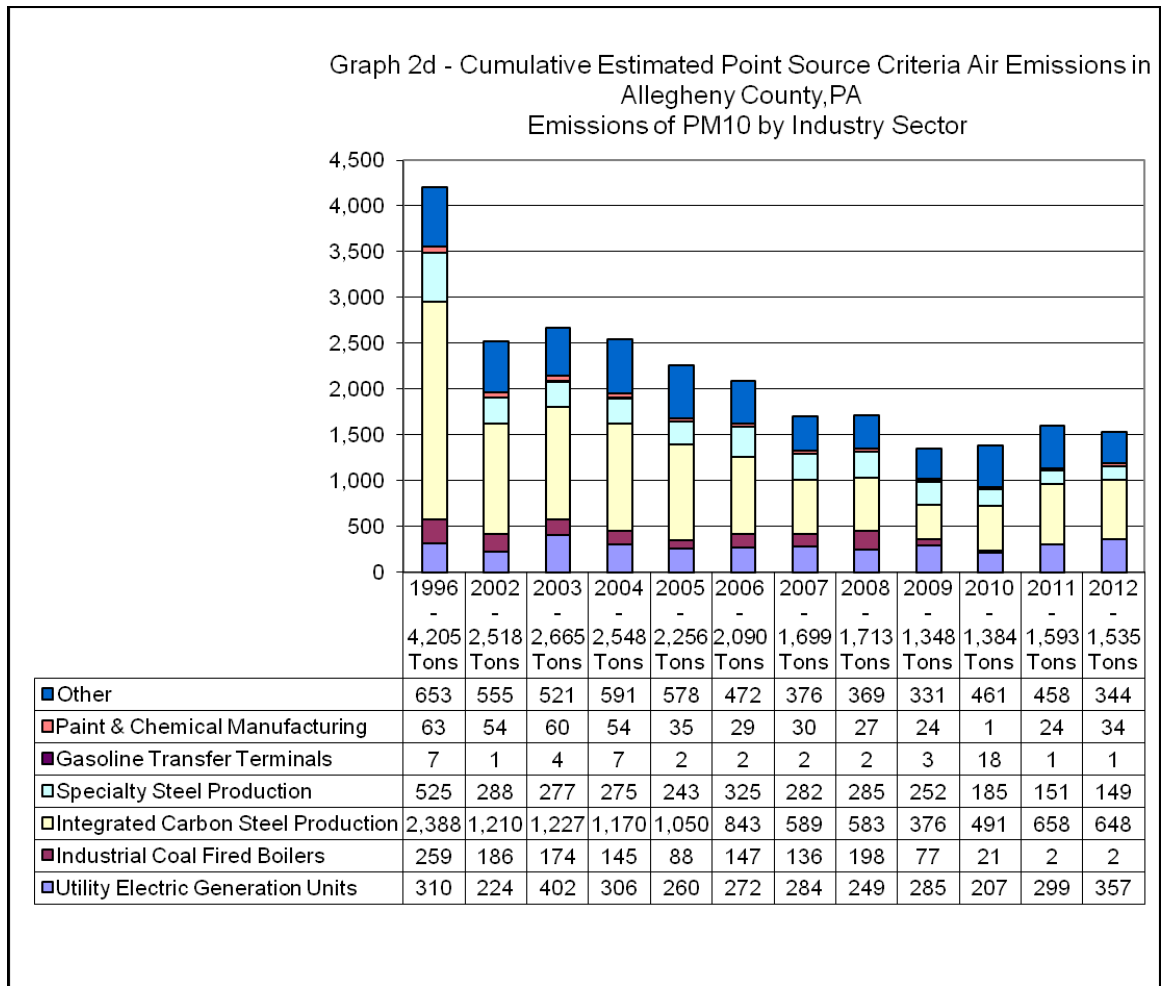

VOC emissions in 2012 decreased 11.2% over 2011. Emissions from the chemical manufacturing sector increased 6.7%. Emissions from integrated carbon steel operations decreased 21.5%, while those from specialty steel production were unchanged. Changes in VOC emissions from the remaining sectors were minor. Gasoline Transfer Terminal's emissions increased 4.9% while those from industrial coal fired boilers fell two tons or 50% from the levels reported in 2011. Similarly Electric Utility VOC emissions fell eight tons or 21.6% while VOC emissions from sources in the other category fell 17.3%. VOC

emissions have declined by 70.4 % at Neville Chemical and 72.8% at Eastman Chemical since 2001. These are the two largest chemical firms in the County. Declines in emissions in the chemical manufacturing sector have decreased as process control improvements have been implemented at these two plants.

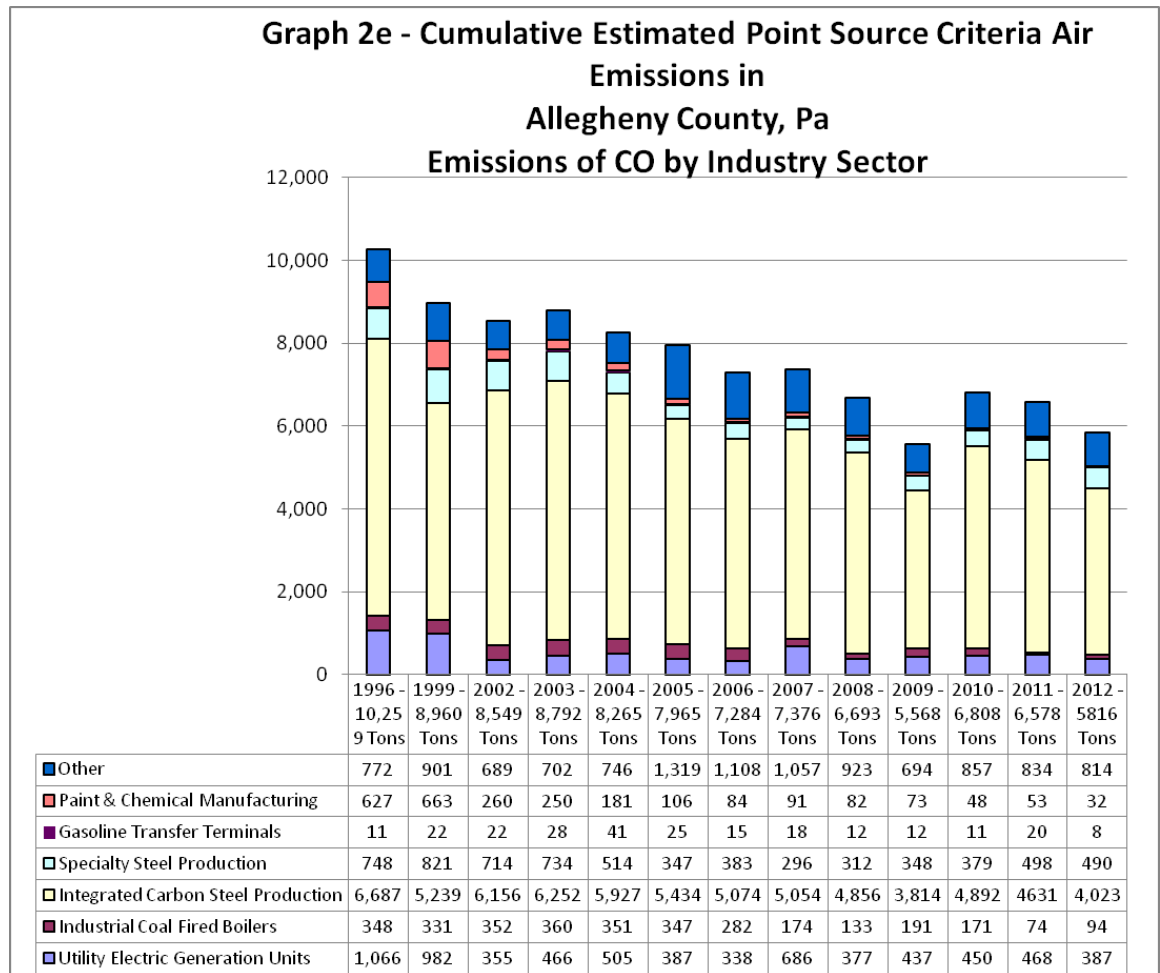

The 11.2% decrease in VOC emissions in 2012 can be attributed to variable business conditions. The large overall decreases in this sector in the past decade are in part attributable to the installation of thermal oxidizers at both major chemical plants and the shutting down of some of the process lines. As Graph 2c illustrates emissions of this pollutant have decreased overall by 47.3% since 2002.

d) PM₁₀

In 2012 PM₁₀ emissions decreased 3.6% from 2011. PM₁₀ emissions increased in the utility sector and declined or remained unchanged in all the rest except paint and chemical manufacturing where there was an increase of 41.7%. The constant level in particulate emissions from the industrial coal fired boiler sector resulted from the installation of a spray dryer bag-house assembly at Bay Valley. Emissions of this pollutant in the integrated carbon steel sector decreased 1.5%. In the specialty steel category PM₁₀ emissions declined 1.3% in 2012. This resulted from a decrease in production at both Universal Stainless and Allegheny Ludlum.

e) Carbon Monoxide

Emissions of carbon monoxide decreased 11.6 % in 2012. Decreases in three sectors were relatively small. The US Steel Clairton Coke Works generates 43.8 % of the carbon monoxide emitted by point sources in Allegheny County. In 2012 carbon monoxide emissions from the Clairton Coke Works decreased 18.1% from 2011 levels. The utility sector decreased 17.3% in 2012. Demand decreased moderately at Cheswick but increased at Springdale. Springdale’s consumption of natural gas increased 582% and their carbon monoxide emissions decreased 49.8%. Cheswick’s emissions of carbon monoxide decreased 16 tons or about 6.1% in 2012. Carbon monoxide emissions from coal fired boilers increased 27 %.

Section III Particulate Emissions and Their Sources

In the Allegheny County Emission Inventory, four forms of particulate matter were reported until 2010. These were total particulate (PT), condensable particulate (PMCond), PM₁₀ and PM_{2.5}. The last two are fractions of total particulate. Below are the definitions of each of these forms

- PT- total filterable particulate is the material captured from flue gas on a filter heated to 248°F.
- PM₁₀ - fraction of filterable particulate with an aerodynamic diameter less than 10 microns
- PM_{2.5} – fraction of filterable particulate with aerodynamic diameter less than 2.5 microns.
- PMCond- material collected from the filtered flue gas after it has passed through the 248°F filter as a gas and been condensed from the sample stream and dried.

PM_{2.5}, PM₁₀ and PT are not independent of each other. PM_{2.5} is a fraction of both PM₁₀ and PT. PM₁₀ is a fraction of PT. Condensable particulate is not part of filterable particulate or its fractions in flue gas. It is a gas that condenses in ambient air to fine particulates.

In the 2011 and 2012 Allegheny County Emission Inventory only PM₁₀ and PM_{2.5} were reported. In 2010 the County adopted the DEP AES web-based emission inventory reporting system. DEP agreed to insert a field into the system to allow the reporting of PM_{2.5}. The DEP system does not contain a field for the reporting of PT because this is no longer considered a reportable criteria pollutant by the EPA. Their sources unlike the County sources do not separate particulate into filterable and condensable fractions for reporting purposes. This changed in 2012 when DEP created a field for PMCond. However, overall the reporting of this fraction of pollutant in 2012 was unsatisfactory.

Graph 3 is an illustration of the amount of PM₁₀ and PM_{2.5} released by each industrial sector through 2012.

Section IV Hazardous Air Pollutants (HAPS)

Facilities are required to report emissions of any of the 187 HAPs listed in ACHD Article XXI, Section 2101.20.a. Article XXI is consistent with EPA Section 112(b) of the Clean Air Act.

Hydrogen sulfide is reported in this category. Hydrogen sulfide is a contaminant listed in Article XXI. Ammonia must be reported because it is a particulate precursor in air. It is reported in Attachment D. Some HAPs are speciated when reported. Speciation is applied to exceptionally toxic HAPS such as hexavalent chromium.

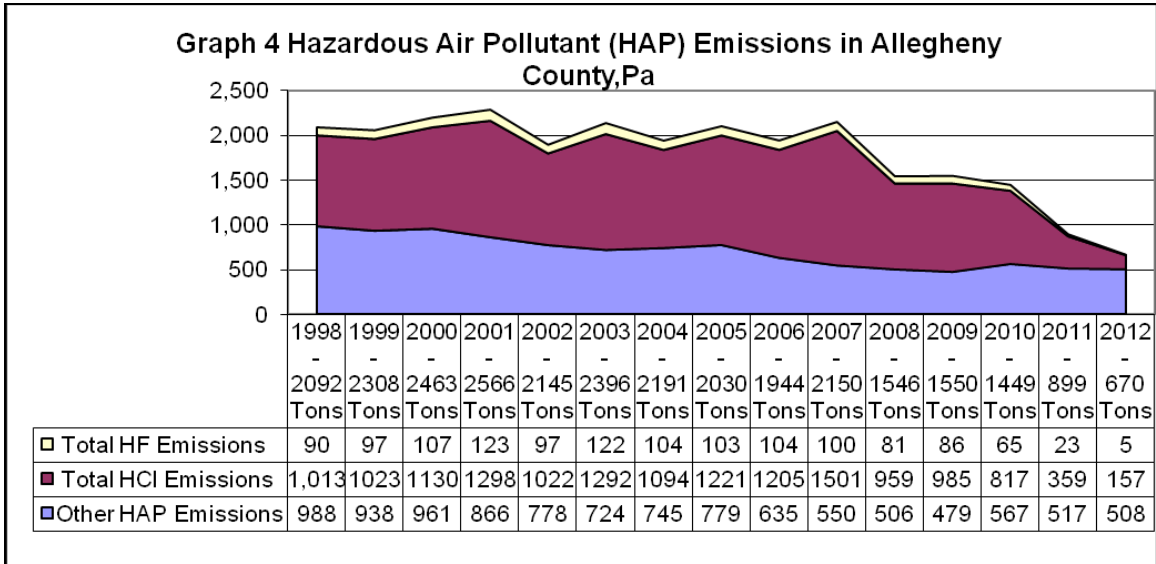

HAP reporting requirements became more stringent with the 1999 Emission Inventory. Speciation for some compounds was introduced. So HAP emission estimates prior to 1999 are not comparable to those from 1999 forward.

Attachment B lists point source HAP emissions in Allegheny County by total amount of individual compound. Adjustments to emissions of hydrochloric acid (HCl) and hydrofluoric acid (HF) are explained following the table.

The impact of exposure to individual HAP compounds varies greatly with both the concentration and the chemical properties of the compound. Exposure concentrations required to observe negative health impacts can differ by several orders of magnitude among different compounds. Synergistic effects of exposure to combinations of HAPs at differing concentrations have not been thoroughly studied.

Section V. HAP Emission Trends

Graph 4 Illustrates HAP emissions trends in Allegheny County.

Hydrogen fluoride (HF) and hydrochloric acid (HCl) constitute 60% of total HAP emissions from County sources for the period 1998-2000. From 2003 through 2006 emissions of these two compounds from the Cheswick Power Station accounted on average for 66 % of total HAP emissions reported by point sources. In 2012 emissions of HCL fell by 56.3 % to 157 tons and emissions of HF fell by 78.3 % to only five tons for the entire county. Total HAP emissions declined 25.5%. HAP emissions from Cheswick fell so precipitously because the utility kept the flue gas desulfurization system operating for most of the year. The three largest sources of HCl emissions currently are the USS Clairton Works, 94.74 tons, the USS Irvin Plant, 24.81 tons and Bay Valley Foods, 16.48 tons. Emissions of HCl from Cheswick in 2012 were only 2.39 tons. In 2012 USS Clairton Works accounted for 60.4% of total HCl emissions. Emissions of HF from Cheswick were only 0.07 tons. In 2012 the largest emitters of HF were Bay Valley Foods accounting for 41.2% of the five ton County total and Gottlieb Inc., an aluminum recycler generating 36.6 % of the total.

Emissions of HCl will fluctuate with operations at the Clairton Coke Works going forward. Since 2002 HCL emissions from this plant have ranged between 95 and 105 tons per year. HF emissions from Bay Valley have ranged between two and three and half tons for the last ten years while Gottlieb only started reporting HF emissions in 2010. This facility’s emissions of HF have been less than two tons per year for the last three years.

When emissions of these two HAPs are excluded from the total, Graph 4 shows emissions of HAP compounds from other sources steadily declined through 2003 falling 19% since 1998 despite a 2.9 % increase in 2004 followed by a 4.6% increase in 2005. These increases were followed by an 18.5 % decline in 2006. In 2007 HAPs from other sources decreased 13.4% below the 2006 level. In 2008 HAP emissions declined a further 8%. With the exclusion of HCL and HF from total HAPS, the emission level of all other HAPS in the County declined another 5.3% in 2009. In 2010 HAP usage in the County increased by 19 %. In 2011 HAP usage in the County declined 9%. But they only fell an additional 2% in 2012. Currently HAP emissions in the

County are about 73 % below emission levels in 2000. Continued decreases in the use of aromatic hydrocarbon solvents are a positive trend among the sources reporting the use of organic solvents.

In 2012 emissions of aromatic hydrocarbons remained about the same as in 2011. Toluene emissions have fallen consistently since 2006 but only decreased a little over two tons from the 2011 reported total. Benzene emissions peaked in 2006 and have trended downward with production at the County's two coke plants and with process improvements at these facilities. In 2012 they decreased 2.5%. In 2012 benzene emissions totaled 37.68 tons. The Clairton Coke Works accounted for 41 % and Shenango 33% of all benzene emissions in the County. Xylene emissions peaked in 2002 and have varied within a range of 27 to 61 tons since but overall have trended downward.

Section VI. Comparison - Emissions of the Cheswick Power Station and USS Clairton Coke Works to Total County Point Source Emissions.

The Cheswick Power Station is no longer the single largest point source emitter of criteria pollutants in Allegheny County. Graph 5 shows its contributions to total CO, PM₁₀, and VOCs is relatively small. Still in 2012 it accounted for 39.5% of nitrogen oxide point source emissions and 29.5% of those of sulfur dioxide emissions. Cheswick's 79.4% reduction in sulfur dioxide emissions from 2011 reflects the successful operation of the flue gas desulfurization equipment at the utility. But the NOx emissions from this source increased 36.1 %. The increase in NOx resulted from the facility reducing the operating hours of the SCR while remaining well under the hourly emission limit of 3051 lbs/hr. By comparison, the Clairton Coke Works generated 30.2% of the NOx and 26.9% of the sulfur dioxide emitted in the County in 2012. Emissions of all criteria pollutants from Clairton totaled 8464 tons while the Cheswick total was only 6991 tons, 17% less. The Clairton Coke Works accounted for 31.9 % of all criteria pollutants emitted in Allegheny County. The Cheswick Power Station accounted for 26.9% of all the criteria pollutants emitted in Allegheny County in 2012.

Graph 5 illustrates the trends of criteria emissions at the Cheswick Power Station from 1997 till 2012.

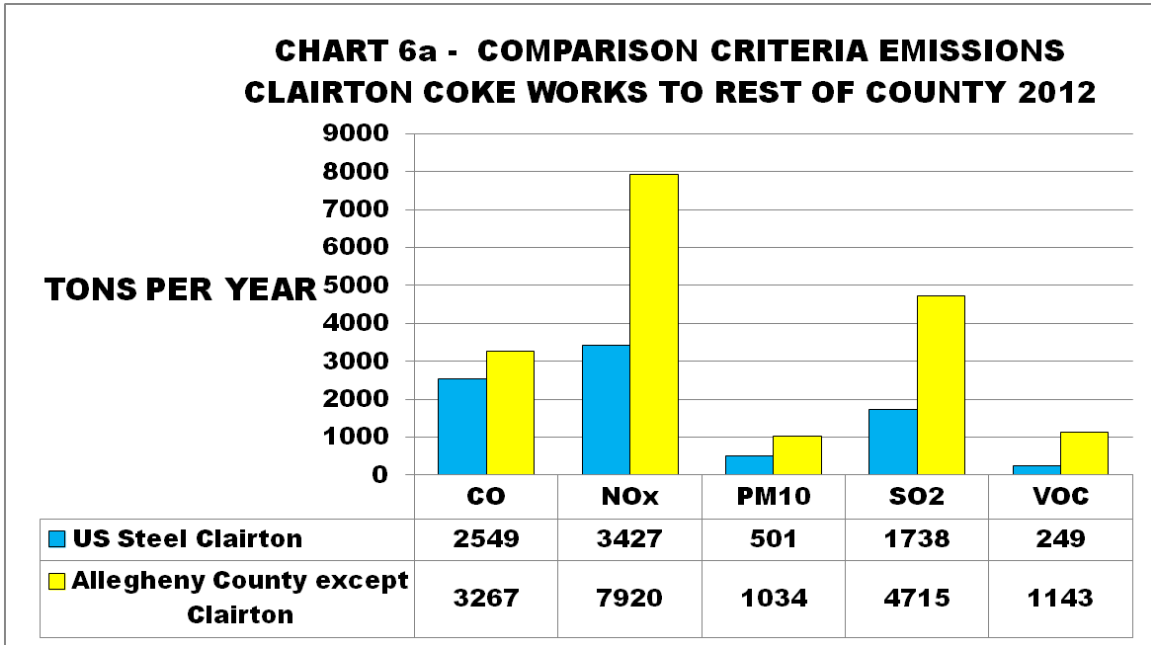

By comparison Graph 6 shows criteria emissions from all the other sources in the County.

Graph 6- Criteria Emissions from Point Sources in Allegheny County Pa, except Cheswick Power Station

	CO	NOx	PM10	SO2	VOC
■ 1997	9,702	17,788	3,728	7,799	4,861
□ 1998	8,551	14,888	3,203	5,881	3,789

Since the US Clairton Coke Works is the largest source of criteria pollutants in Allegheny County, Graph 6a compares emissions in 2012 from this source to the total from the rest of the sources reporting emission in 2012.

Clairton’s 2012 emissions accounted for the following percentages of the totals reported in the 2012 ACHD Air Quality Emission Inventory.

- CO - 43.8%
- NO_x - 30.2%
- PM₁₀ - 32.6%
- SO₂ - 24.9%
- VOC – 17.9%

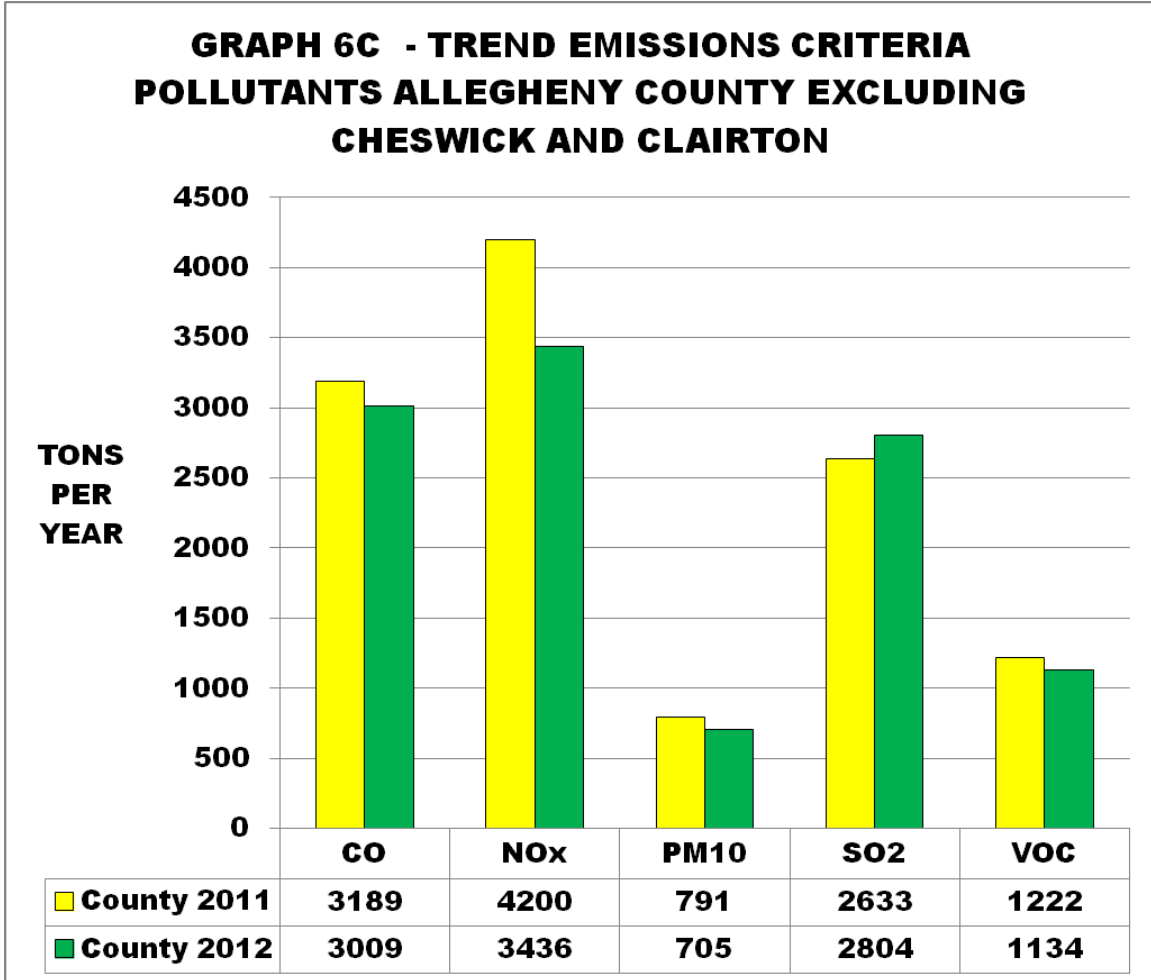

Graph 6b compares criteria emissions in 2012 from the Clairton Coke Works to those from the Cheswick Power Station.

Graph 6b shows Cheswick's emissions of NO_x exceeded Clairton's by 30.8% and those of SO₂ by 10%. But emissions of carbon monoxide, volatile organic compounds and PM₁₀ from the Clairton Coke Works exceeded those from the Cheswick Power Station.

Operations at Cheswick fluctuate with the demand for electricity, which is dependent on many economic factors. Demand for power from the plant no longer disproportionately determines the total level of pollution in the County. In 2012 both the Cheswick Power Plant and the USS Clairton Coke Works dominated emission levels in the County. Both plants generated 48.3 % of the carbon monoxide emitted, 69.8% of the NO_x, 54.1 % of the PM₁₀, 56.4% of the SO₂, and 18.5% of the VOCs. Emissions from both plants now mask the overall decline in the emissions of all criteria pollutants from the remainder of the sources located in Allegheny County.

Graph 6c illustrates and compares the trend in emissions of criteria pollutants from the remainder of the sources in Allegheny County in 2011 and 2012.

In 2009 emissions of SO₂ totaled nearly 41,000 tons. In 2012 the total was only 6,473 tons. Much of the decrease in sulfur dioxide levels can be attributed to the switch to natural gas from coal at Bellefield Boilers, improved and consistent operation of the flue gas desulfurization equipment at Cheswick and consistent operation of the desulfurization plant at Clairton. The 6.5 % increase in sulfur dioxide emissions in 2012 was caused by increases in emissions of this compound at all three US Steel plants. It resulted from the malfunction at the Clairton desulfurization plant in September 2012.

Graph 7 examines trends of emissions of criteria pollutants from the Cheswick Power Station as a function of production since 1990. The sulfur content of the coal burned in 2012 was 3.87%. In 2011 the sulfur content of the coal burned by Cheswick was 3.19%. Sulfur dioxide emissions per unit of energy consumed fell sharply between 2011 and 2012. The decrease in sulfur dioxide emissions between 2011 and 2012 can be directly attributed to operation of the plant's scrubber. Sulfur dioxide emissions decreased 79.4% while the tons of coal burned decreased 5.8%.

The installation of particulate and nitrogen oxide control equipment has contributed to the overall decline of emissions of these two pollutants since 1990. The installation of a Selective Catalytic Reduction System (SCR) in 2003 while reducing NO_x emissions increased particulate emission. In 2012 NO_x emissions increased 31% and PM10 emissions increased 14.1%. The amount of coal burned while operating the SCR only totaled 3163 tons or 0.3% of the total coal burned at this facility. Increases in emissions of these two pollutants correlates with the amount of coal burned while not operating the SCR.

Notes to the report:

1. Estimation of PM_{2.5} and condensable particulate (PMCOND) emissions started with the 1999 inventory year. PM and condensable particulate were not reported for 2011 or 2012. Reporting of PM condensable will resume in 2013.
2. Hydrogen sulfide is considered a pollutant in Allegheny County. Ammonia is a particulate precursor. Hydrogen sulfide is listed in the HAPS Table while ammonia is in a separate table. They are not among the 187 compounds designated HAPs by USEPA. Speciated compounds of very toxic HAPs such as hexavalent chromium and dioxin isomers are not specifically listed in ACHD Article XXI as HAPS, but are reported at de-minimus emission levels in the inventory.
3. Lead emissions are included in the HAPs tables.
4. Definitions of Emissions
 - 4.1. Filterable Particulate – Material emitted as liquid or solid at 248°F
 - 4.2. Condensable Particulate (PMCOND) – Material that is not filterable at 248°F and condenses when passed through water in an ice bath.
 - 4.3. Total Particulate (PT) – Filterable Particulate
 - 4.4. PM₁₀ - Filterable particulate with aerodynamic diameter less than 10 microns.
 - 4.5. PM_{2.5} - Filterable particulate with aerodynamic diameter less than 2.5 microns
 - 4.6. Volatile Organic Compounds (VOCs) – Organic material that is photo reactive and a gas at 250°F. It contributes to the formation of ozone.
5. The Attachment B lists yearly emissions of HAPs for each source from 1999 - 2012. HAP emissions were estimated prior to this, but results are believed to be less accurate.
6. The Bay Valley facility, formerly Heinz, is in the category Industrial Coal Fired Boiler.
7. Emission estimates for each facility are calculated each year. Estimates of previous years are not normally updated if emission factors or estimation techniques change for processes.

Note 1: Ammonia emissions are reported on Attachment D

Note 2: All compounds with zero emissions for the period covered by the table have been deleted.

Adjustments to “Attachment B - Total Point Source HAP Emissions”

Previous emission inventory assessments are not normally recalculated when estimation methods are improved or emission factors updated. Therefore, apparent changes in the amounts of emissions reported may not be actual. An exception has been made for the acid gases HCl and HF, and adjustments have been made to previous years' inventories.

Examples are the estimates of emissions of the two acid gasses from the Cheswick Power Station. Changes in the emission factors used for HCl and HF during 2002 produced estimates different enough to significantly affect the reported HAP emissions from this plant, total emissions of these pollutants and the total HAP emission inventory.

During 2000, source testing was performed for HCl emissions from coke oven stacks at the USS Clairton Coke Plant. This testing found HCl emissions not previously detected. These emissions were included in the 2000 and later inventories.

Adjustments were made to previously reported Total Point Source HAP Emissions to account for these changes. Adjusted values are used for this comparison only. Agency emission inventory records have not been adjusted.

Emissions of hydrochloric acid (HCl) are about 52% of the total emissions in Attachment B.

Attachment C
Hazardous Air Pollutant Emissions
Individual Facilities

2012 ANNUAL EMISSIONS INVENTORY REPORT

ATTACHMENT C:

Estimated Point Source Emissions of
Hazardous Air Pollutants & Hydrogen Sulfide
