

Baby Formula Shortage Information

Appropriate nutrition is important for babies under the age of 1; they need the correct balance of nutrients to maintain their rapid growth and development.

Breast milk contains these; formulas are specially designed to best mimic this and meet the needs.

Why the shortage?

- **There are supply issues** for ingredients, packaging, labor as well as shipping.
- **The recall earlier this year contributed as well.** The duration is unknown, but urgent need is recognized with efforts underway to reverse situation as quickly as possible.

If you can't find formula, – DOs

- **Contact your pediatrician for samples** (if available) or contacts that can provide a supply or your local WIC office, 2-1-1 (United Way) or food bank/SNAP may also be able to provide suggest places to check.
- **Check smaller stores and pharmacies**, which may have a supply when the bigger stores do not.
- **Shop for formula online**, purchasing from well-recognized sites rather than individually sold or auctions which may sell expired or lower quality products. Do not purchase formula from overseas, since imported formula is not FDA-reviewed or approved and may not be up to recognized nutritional and safety standards.
- **For most babies, it is OK to switch** to any available formula, including store brands, unless your baby is on a specific extensively hydrolyzed or amino acid-based formula (hypoallergenic) such as Alimentum/ Nutramigen/ Elecare (no store brand exists). If you are unsure, talk with your pediatrician. With brand changes, babies may get an upset stomach, be a little fussy or have a change in stool (bowel movements) as they adjust to the change.
- **Check social media groups.** There are groups dedicated to infant feeding and formula, and members may have ideas for where to find formula. Make sure to check any advice with your pediatrician.
- **Formula share with a friend** or within a group of parents – “borrow” a can if able.

DO NOT

- **Make your own formula** – recipes for homemade formulas may seem healthy, less expensive, or an option during this shortage, they are not safe and do not meet your baby's nutritional needs. Infant deaths have been reported from use of some homemade formulas.
- **Add extra water to “stretch” your supply** –Watering down formula is dangerous. It can cause nutritional imbalances in your baby and lead to serious health problems. Always mix formula as directed by the manufacturer.
- **Switch to cow's milk** – difficult to completely digest under 1 year, not correct nutrient balance which can stress baby's body and lead to health problems.
- **Use milk alternatives** – not recommended under a year; especially plant-based milks which are low in protein and minerals.
- **Use recalled or expired formula.**
- **Use toddler formulas** – not recommended under a year, not FDA regulated – may be OK for a few days if no other choice and close to first birthday.
- **Stockpile** – if you find a supply limit purchases to enough for a 10-14 day span.

If no formula is available, infants older than 6 months, who have started baby food and currently drink a cow's milk formula, may use whole milk for a short duration along with iron rich foods, until infant formula can be obtained.
